LITTLE G. T. FOR $l_p$-LATTICE SUMMING OPERATORS

Lahcène Mezrag

Communicated by L. Tzafriri

Abstract. In this paper we introduce and study the $l_p$-lattice summing operators in the category of operator spaces which are the analogous of $p$-lattice summing operators in the commutative case. We study some interesting characterizations of this type of operators which generalize the results of Nielsen and Szulga and we show that $\Lambda_{l_1}(B(H), OH) \neq \Lambda_{l_2}(B(H), OH)$, in opposition to the commutative case.

Introduction. The notion of $p$-lattice summing was introduced and studied by Yanovskii in [24] for $p = 1$ and generalized by Nielsen and Szulga in [16, 22]. In this paper we extend this notion and some results to the theory of operator spaces (or the non-commutative case) which is recently studied by [1, 2, 3, 6, 7, 19, 20, 21].

2000 Mathematics Subject Classification: 46B28, 47D15.

Key words: Banach lattice, completely bounded operator, convex operator, $l_p$-lattice summing operator, operator space.

*This research is partially supported by the Kuwait Foundation for the Advancement of Sciences
The paper is divided into four sections. In the first one, we recall some classical definitions and we give some preliminary facts such that: convexity and concavity, order bounded operators and the notion of $p$-summing operators.

In section two, we try to recover some definitions and results concerning the recent theory of operator spaces and we give some remarks about completely bounded operators.

We study in section three the notion of $l_p$-lattice summing operators $u : E \to Y$ between an operator space $E$ and a Banach lattice $X$, which extends the $p$-lattice summing operators. This generalization is a natural non-commutative analogous of the notion of $p$-lattice summing operators. We show some interesting characterizations of this type of operators. We also give briefly the connection between $l_p$-summing (as studied in [14]) and $l_p$-lattice summing operators for some special spaces.

In the final section, we show that

$$\pi_{l_p}(B(H), OH) \neq \Lambda_{l_2}(B(H), OH)$$

for all $2 < p < \infty$ in contrast to Banach space theory.

We finish this paper by mentioning that the little Grothendieck’s theorem is not true for this notion.

1. Notation and preliminaries. For the background concerning ordered vector spaces and Banach lattices we refer to [13] and [25]. Let $n$ be an integer. For a Banach lattice $X$ and $1 \leq p \leq \infty$, we denote by $X(l^n_p)$ (the reader can consult [13, Part II, pp. 40–43]) the space of all sequences $x = (x_1, \ldots, x_n)$ of elements of $X$ for which

$$\|x\|_{X(l^n_p)} = \left\| \left( \sum_{i=1}^{n} |x_i|^p \right)^{\frac{1}{p}} \right\|$$

if $1 \leq p < \infty$

and

$$\|x\|_{X(l^n_\infty)} = \left\| \sup_{1 \leq i \leq n} |x_i| \right\|$$

if $p = \infty$.

The space $X(l^n_p)$ is a Banach lattice equipped with the natural order

$$x \leq y \iff \forall i, \ x_i \leq y_i.$$
Let now $X$ be a Banach space and $1 \leq p \leq \infty$. We denote by $l_p(X)$ (resp. $l_p^\omega(X)$) the space of all sequences $(x_i)$ in $X$ with the norm

$$\| (x_i) \|_{l_p(X)} = \left( \sum_{i=1}^{\infty} |x_i|^p \right)^{\frac{1}{p}}$$

and by $l_p^\omega(X)$ (resp. $l_p^\omega(X)$) the space of all sequences $(x_i)$ in $X$ with the norm

$$\| (x_n) \|_{l_p^\omega(X)} = \sup_{\| \xi \|_{X^*} = 1} \left( \sum_{i=1}^{\infty} |\langle x_i, \xi \rangle|^p \right)^{\frac{1}{p}}$$

We continue these preliminaries by recalling the definition of the $p$-convexity and $p$-concavity.

**Definition 1.1.** Let $E$ be an arbitrary Banach space, $X$ a Banach lattice and let $1 \leq p \leq \infty$.

(i) A linear operator $u : E \to X$ is called $p$-convex if there is a constant $C$ such that, for all $n$ in $\mathbb{N}$ the operators

$$l_p(E) \to X, \quad (x_1, \ldots, x_n) \mapsto (u(x_1), \ldots, u(x_n))$$

are uniformly bounded by $C$.

(ii) A linear operator $u : X \to E$ is called $p$-concave if there is a constant $C$ such that, for all $n$ in $\mathbb{N}$ the operators

$$X \to l_p(E), \quad (x_1, \ldots, x_n) \mapsto (u(x_1), \ldots, u(x_n))$$

are uniformly bounded by $C$.

The smallest constant $C$ for which this holds is denoted by $C_p(u)$ and $C_p(u)$ respectively.

A Banach lattice $X$ is $p$-convex (resp. $p$-concave) if $id_X$ is $p$-convex (resp. $p$-concave).
Remark 1.2. Any linear $p$-convex (resp. $p$-concave) operator $u$ is bounded and $\|u\| \leq C_p(u)$ (resp. $\|u\| \leq C_p(u)$).

Every Banach lattice is $1$-convex and $1$-concave. The $p$-convexity and $p$-concavity for $1 \leq p \leq \infty$ are decreasing and increasing in $p$, respectively see [13, Part II. 1.d.5]. For example, $L_p$ for $1 \leq p < \infty$ is $p$-convex and $p$-concave, and $C_p(L_p) = C_p(L_p) = 1$.

Suppose now that $X$ is a complete Banach lattice. An operator $u \in B(E,X)$ is called order bounded (see [15, 8]) if $u(B_X)$ is an order bounded subset of $X$. In this case, we put

$$M(u) = \|\sup_{x \in B_X} |u(x)|\|.$$

We can show that (see [22] or [11]) $M$ is a norm on $M(E,X)$, the space of all order bounded maps from $E$ to $X$.

If $w : X \rightarrow Y$ (Y a complete Banach lattice) is a positive operator (i.e., $w(x) \geq 0$, for all $x$ in $X^+$), then $wu$ is order bounded.

The following simple remark will be needed in the sequel. For more precision see for example [8, Lemma 1.1].

Remark 1.3. Let $n$ be an integer and $X$ be a Banach lattice. Let $v : l^n_1 \rightarrow X$ such that $v(e_i) = x_i$ ($1 \leq p \leq \infty$). We have

$$(1.1) \quad M(v) = \|(x_i)_{1 \leq i \leq n}\|_{X(\ell_1^p)} = \left\| \left( \sum_{i=1}^{n} |x_i|^p \right)^{\frac{1}{p}} \right\|.$$

If $X = C(K)$, $M(v) = \|v\|$. We give now the $p$-lattice summing ($1 \leq p \leq \infty$) notion for operators from a Banach space with values in a Banach lattice. It was first studied by Yanovskii in [24] for $p = 1$ and by Nielsen and Szulga in [16] and [22] for $p > 1$.

Definition 1.4. Let $1 \leq p \leq \infty$. Let $X$ be a Banach space, $Y$ a Banach lattice and let $u : X \rightarrow Y$ be a linear operator. We will say that $u$ is “$p$-lattice summing” if there is a positive constant $C$ such that for every $n$ in $\mathbb{N}$ and $(x_1, \ldots, x_n)$ in $E$, we have

$$\|u(x_i)\|_{X(\ell_1^p)} \leq C \|(x_i)\|_{l_1^p} \omega(E).$$

(If $p = \infty$ the sums should be replaced by sup).

We write $\lambda_p(u)$ for the smallest constant $C$ satisfying the above inequality.

We will denote by $\Lambda_p(E,X)$ the space of all $p$-lattice summing operators, which is a Banach space if we consider as the norm $\lambda_p(\cdot)$. 

Remark 1.5. Let \( u : E \rightarrow X \) be a linear operator from a Banach space \( E \) into a complete Banach lattice \( X \). Then,
\[
u \in \Lambda_\infty (E, X) \iff u \text{ is } \infty\text{-convex} \iff u \in M (E, X)
\]
and
\[
\lambda_\infty (u) = C^\infty (u) = M (u).
\]

2. An introduction to operator spaces. If \( H \) is a Hilbert space, we let \( B(H) \) denote the space of all bounded operators on \( H \) and for every \( n \) in \( \mathbb{N} \) we let \( M_n \) denote the space of all \( n \times n \)-matrices of complex numbers, i.e., \( M_n = B(l_2^n) \). If \( X \) is a subspace of some \( B(H) \) and \( n \in \mathbb{N} \), then \( M_n (X) \) denotes the space of all \( n \times n \)-matrices with \( X \)-valued entries which we in the natural manner consider as a subspace of \( B(l_2^n (X)) \). An operator space \( X \) is a norm closed subspace of some \( B(H) \) equipped with the distinguished matrix norm inherited by the spaces \( M_n (X) \), \( n \in \mathbb{N} \).

In [19], Pisier constructed the operator Hilbert space \( OH \) (i.e., the unique space verifying \( \overline{OH} = OH \) completely isometrically as in the case of Banach spaces, because there are Hilbert spaces in this category which are not completely isometric) and generalized in [20] (also Junge [9]) the notion of \( p \)-summing operators to the non-commutative case.

Let \( H \) be a Hilbert space. We denote by \( S_p (H) \) (\( 1 \leq p < \infty \)) the Banach space of all compact operators \( u : H \rightarrow H \) such that \( \text{Tr} (|u|^p) < \infty \), equipped with the norm
\[
\|u\|_{S_p (H)} = (\text{Tr} (|u|^p))^{\frac{1}{p}}.
\]

If \( H = l_2 \) (resp. \( l_2^n \)), we denote simply \( S_p (l_2) \) by \( S_p \) (resp. \( S_p (l_2^n) \) by \( S^n_p \)). We denote also by \( S_\infty (H) \) (resp. \( S_\infty \)) the Banach space of all compact operators equipped with the norm induced by \( B(H) \) (resp. \( B(l_2^n) \) \( (S^n_\infty = B(l_2^n)) \)). Recall that if \( \frac{1}{p} = \frac{1}{q} + \frac{1}{r} \) \( (1 \leq p, q, r < \infty) \), then \( u \in B_{S_p (H)} \) if and only if there are \( u_1 \in B_{S_q (H)} \), \( u_2 \in B_{S_r (H)} \) such that \( u = u_1 u_2 \), where \( B_{S_p (H)} \) is the closed unit ball of \( S_p (H) \).

Let now \( X \) be a vector space. If for each \( n \in \mathbb{N} \), there is a norm \( \|\cdot\|_n \) on \( M_n (X) \), the family of norms \( \{\|\cdot\|_n\}_{n \geq 1} \) is called an \( L_p \)-matricial structure on \( X \) for \( 1 \leq p \leq \infty \) if: for all \( a, b \) in \( M_n (\mathbb{C}) = B (l_2^n) ; \) \( x \in M_n (X) \) and \( y \in M_m (X) \) we have
\[
(i) \quad \|a x b\|_n \leq \|a\|_{M_n (\mathbb{C})} \|x\|_n \|b\|_{M_n (\mathbb{C})}
\]
\[
(ii) \quad \|x \oplus y\|_{n+m} = \begin{cases} \|x\|^p_n + \|y\|^p_m & \text{if } p \text{ is finite} \\ \max \{\|x\|_n, \|y\|_m\} & \text{if } p \text{ is infinite}, \end{cases}
\]

Little G. T. for \( l_p \)-lattice summing operators
where
\[ \| x \oplus y \|_{n+m} = \left\| \begin{pmatrix} x & 0 \\ 0 & y \end{pmatrix} \right\|_{n+m}. \]

We say that \( X \) is \( L_p \)-matricially normed if it is equipped with an \( L_p \)-matricial structure (which we suppose complete). Ruan proved in [21] and simplified (with Effros) in [7] an important theorem which is an abstract matrix norm characterization of operator spaces. This theorem states that: for any \( L_1 \)-matricial structure on a vector space \( X \), there is a Hilbert space \( H \) and an embedding of \( X \) into \( B(H) \) such that for all \( n \geq 1 \), the norm \( \| \cdot \|_n \) on \( M_n(X) \) coincides with the norm induced by the space \( B(l_2^n(H)) \). In other words, he has given an abstract characterization of operator spaces. Also in [12] we have proved that, if \( X \) is \( p \)-matricially normed with \( p = 1 \), then there is an operator structure on \( X \) such that \( M_n(X) = S_1^n[X] \), where \( S_1^n[X] \) is the finite dimensional version of \( S_1[X] = S_1 \otimes X \), the projective tensor product of \( S_1 \) by \( X \) which is introduced in [3, 6] and [6]. For \( p \neq 1 \), the problem is open.

**Definition 2.1.** Let \( H, K \) be Hilbert spaces. Let \( X \subseteq B(H) \) and \( Y \subseteq B(K) \) be two operator spaces. A linear map \( u : X \rightarrow Y \) is completely bounded (in short \( c.b. \)) if the maps
\[ u_n : M_n(X) \rightarrow M_n(Y) \]
\[ (x_{ij})_{1 \leq i,j \leq n} \rightarrow (u(x_{ij}))_{1 \leq i,j \leq n} \]
are uniformly bounded when \( n \rightarrow +\infty \), i.e. \( \sup_{n \geq 1} \| u_n \| < +\infty \).

In this case we put, \( \| u \|_{cb} = \sup_{n \geq 1} \| u_n \| \) (\( \Rightarrow \| u \| \leq \| u \|_{cb} \)) and we denote by \( cb(X,Y) \) the Banach space of all \( c.b. \) maps from \( X \) into \( Y \) which is also an operator space \( (M_n(cb(X,Y)) = cb(X,M_n(Y)) \), see [3, 6]. If we denote by \( X \otimes_{\min} Y \) the subspace of \( B(H \otimes_2 K) \) with induced norm, it is well known by [17] that
\[ \| u \|_{cb} = \| I_{B(l_2)} \otimes u \|_{B(l_2) \otimes_{\min} X \rightarrow B(l_2) \otimes_{\min} Y}. \]

We continue our introduction by mentioning briefly some properties concerning completely bounded operators. Consider \( Y \subseteq A \) (a commutative \( C^* \)-algebra) \( \subseteq B(H) \) and let \( X \) be an arbitrary operator space. Then,
\[ B(X,Y) = cb(X,Y) \]
and
\[ (2.1) \quad \| u \| = \| u \|_{cb}. \]
Because $M_n \otimes_{\text{min}} Y \equiv M_n \otimes Y$ isometrically ($M_n \otimes Y$ is the injective tensor product of $M_n$ by $Y$ in the commutative case), see for example [18, p. 69, Corollary 3.18].

We recall that by [19, Proposition 1.5, p. 18] $OH$ is homogeneous, namely, every bounded linear operator $u: OH \rightarrow OH$ is automatically $c.b$ and

\begin{equation}
\|u\| = \|u\|_{cb}.
\end{equation}

Note also by Corollary 2.4 in [19] that $S_2$ is completely isometric to $OH \times OH$. We denote by $OH_n$ the $n$-dimensional version of the Hilbert operator space $OH$. If now $S_2^N$ ($N \in \mathbb{N}$) is equipped with the operator space structure $OH_{N^2}$, then for any linear map $u: S_2^N \rightarrow OH_{N^2}$ we have by homogeneity of $OH$

\begin{equation}
\|u\| = \|u\|_{cb}.
\end{equation}

Let now $X \subset B(H)$. We have by Pisier [20, p. 32]

$$l_\infty (X) = l_\infty \otimes_{\text{min}} X = B (l_1, X).$$

We can show that for all $n$ in $\mathbb{N}$ and $1 \leq p \leq \infty$

\begin{equation}
\|v\|_{cb} = \sup_{a,b \in B(S_p(H))} \left( \sum_{1}^{n} (ax,b)_{S_p(H)}^p \right)^{\frac{1}{p}} = \left\| \sum_{1}^{n} e_j \otimes x_j \right\|_{l_p \otimes_{\text{min}} X}
\end{equation}

if $p$ is finite and

\begin{equation}
\|v\|_{cb} = \left\| \sum_{1}^{n} e_j \otimes x_j \right\|_{l_p \otimes_{\text{min}} X} = \left\| \sum_{1}^{n} e_j \otimes x_j \right\|_{l_p \otimes X} = \|v\|
\end{equation}

if $p = \infty$. Where $v : l_p^n \rightarrow X$ such that $v(e_i) = x_i$.

3. $l_p$-lattice summing operators. We now give the $l_p$-lattice summing ($1 \leq p \leq \infty$) notion for operators from an operator space with values in a Banach lattice as an adaptation of the non-commutative case see [9, 14] to $p$-lattice summing as used in [22, 24] and we characterize them. The non-commutative version can be introduced as follows.

**Definition 3.1.** Let $1 \leq p \leq \infty$. Let $E \subset B(H)$ be an operator space, $X$ be a complete Banach lattice and $u : E \rightarrow X$ be a linear operator. We will
say that \( u \) is \( l_p \)-lattice summing if there is a positive constant \( C \) such that for every \( n \) in \( \mathbb{N} \) the mappings

\[
U_n : \ell_p^n \otimes_{\min} E \longrightarrow X ( l_p^n )
\]

\[
\sum_1^n e_i \otimes x_i \longmapsto ( u(x_1), \ldots, u(x_n) )
\]

are uniformly bounded by \( C \) (i.e. \( \| U_n \|_{\ell_p^n \otimes_{\min} E \longrightarrow X ( l_p^n )} \leq C \)).

We denote by \( \lambda_{l_p} ( u ) = \sup_n \| U_n \|_{\ell_p^n \otimes_{\min} E \longrightarrow X ( l_p^n )} \).

We will denote by \( \Lambda_{l_p} ( E, X ) \) the space of all \( l_p \)-lattice summing operators and we equip it with the norm \( \lambda_{l_p} ( \cdot ) \) for which it becomes a Banach space.

We will need by (2.4) and (2.5) the following reformulation of the above definition.

The operator \( u \) is \( l_p \)-lattice summing and \( \lambda_{l_p} ( u ) \leq C \), if and only if, for every \( n \) in \( \mathbb{N} \) and every linear operator \( v : \ell_p^n \longrightarrow E \) we have

\[
\left\| \left( \sum_1^n | uv ( e_i ) |^p \right)^{\frac{1}{p}} \right\| \leq C \| v \|_{cb}
\]

for \( p < \infty \). For the case \( p = \infty \), the sum should be replaced by sup. The space \( \ell_p^n \) is equipped with its natural operator space structure, see [20, Chapter 2].

From this equivalence we obtain the following remark.

**Remark 3.2.**

1. \( p \)-lattice summing \( \implies l_p \)-lattice summing and \( \lambda_{l_p} ( u ) \leq \lambda_p ( u ) \).
2. Let \( E \subset A \) (a commutative \( C^* \)-algebra) \( \subset B ( H ) \) and let \( X \) be an arbitrary Banach lattice. Then by (2.1) and (3.1), we have

\[
\Lambda_{l_p} ( E, X ) = \Lambda_p ( E, X ).
\]

3. If \( E = O H \) we have, \( \Lambda_{l_2} ( E, X ) = \Lambda_2 ( E, X ) \) and \( \lambda_{l_2} ( u ) = \lambda_2 ( u ) \) because \( l_2 ( I ) \) is by [20, Proposition 2.1, p. 32] completely isometric to \( O H ( I ) \) for any index set \( I \).

Recalling now the definition of \( l_p \)-summing operator as studied in [14]. An operator \( u \) between an operator space \( E \subset B ( H ) \) and a Banach space \( X \) is \( l_p \)-summing if there is a constant \( C \) such that for all \( n \) in \( \mathbb{N} \) and all finite sequence \( ( x_i )_{1 \leq i \leq n} \) in \( X \), we have

\[
\left( \sum_1^n \| u ( x_i ) \|^p \right)^{\frac{1}{p}} \leq C \sup_{a, b \in B_{\ell_{2p}} ( H )} \left( \sum_1^n \| a x_i b \|_{S_p}^p \right)^{\frac{1}{p}}.
\]
In other words, $u$ transform weakly $l_p$-summable sequences in the non-commutative case into strongly $l_p$-summable sequences in the commutative case.

We denote by $\pi_p(u)$ the smallest constant $C$ for which this holds and by $\Pi_p(E, X)$ the space of all $l_p$-summing operators with the norm $\pi_p(\cdot)$ which becomes a Banach space. We have

4. $X$, $p$ - concave $\Rightarrow (\lambda_p(u) \Rightarrow \pi_p(u))$,
$X$, $p$ - convex $\Rightarrow (\pi_p(u) \Rightarrow \lambda_p(u))$,
$X = L_p$ $\Rightarrow (\pi_p(u) = \lambda_p(u)).$

**Remark 3.3.** We have from (2.3) that the operator $u$ is $l_p$-lattice summing and $\lambda_p(u) \leq C$ if and only if

$$
\left(\sum_{i=1}^{n} |u(x_i)|^p \right)^{\frac{1}{p}} \leq C \sup_{a,b \in B_{2p}(H)} \left(\sum_{n=1}^{\infty} \|ax_i b\|_{S_p(H)}^p\right)^{\frac{1}{p}}
$$

if $p$ is finite and if $p$ is infinite we have by (2.5)

$$
\Lambda_{1\infty}(E, X) = \Lambda_{\infty}(E, X)
$$

and

$$
\lambda_{1\infty}(u) = \lambda_{\infty}(u).
$$

Let now $u : X \rightarrow Y$ be a bounded linear operator between Banach lattices $X, Y$. We say that $u$ is $p$-regular ($1 \leq p \leq \infty$) if there is a positive constant $C$ such that for all finite sequence $(x_i) \subset X$, we have

$$
\left\| \left(\sum |T(x_i)|^p \right)^{\frac{1}{p}} \right\| \leq C \left\| \left(\sum |x_i|^p \right)^{\frac{1}{p}} \right\|.
$$

The best possible constant will be denoted by $\rho_p(u)$.

We will denote by $\rho_p(X, Y)$ the space of all $p$-regular operators and we equip it with the norm $\rho_p(\cdot)$ for which it becomes a Banach space.

Recall that by Krivine [10] (see also [13, Part.II.1.f.14 and 1.d.9]) every linear operator is 2-regular and every positive operator is $p$-regular for $1 \leq p \leq \infty$. If $p = 2$, $\rho_p(w) = K_G \|w\|$ ($K_G$ is the universal Grothendieck constant) and $\rho_p(w) = \|w\|$ if $p \neq 2$.

**Proposition 3.4.** If $X = C(K)$, we have

$u$ is $p$-regular if and only if $u$ is $l_p$-lattice summing.
\[ \rho_p(u) = \lambda_{l_p}(u). \]

**Proof.** By (2.1), it is easy to see that: \( u \) is \( p \)-regular if and only if for every \( n \in \mathbb{N} \) and \( v : l_p^n \rightarrow X \), we have

\[
\left\| \left( \sum_{i=1}^{n} |uv(e_i)|^p \right)^{\frac{1}{p}} \right\| \leq \rho_p(u)M(v).
\]

By Remark 1.3, we have \( M(v) = \|v\| = \|v\|_{cb} \) (Remark 3.2.2) and we conclude by the proof, because \( \|v\| = \|v(e_i)\|_{cb} \).

**Remark 3.5.** (i) Clearly the class of \( l_p \)-lattice summing operators is not an ideal in Pietsch’s sense but it is an ideal on left. Indeed, consider \( u, E, X \) as in Definition 3.1. Let \( E_0 \) be an operator space and let \( u_0 : E_0 \rightarrow E \) be a completely bounded operator. Then by (3.1), we have

\[
\left\| \left( \sum_{i=1}^{n} |uu_0v(e_i)|^p \right)^{\frac{1}{p}} \right\| \leq \lambda_{l_p}(u) \|u_0v\|_{cb} \leq \lambda_{l_p}(u) \|u_0\|_{cb} \|v\|_{cb}.
\]

Hence, \( uu_0 \) is \( l_p \)-lattice summing and \( \lambda_{l_p}(uu_0) \leq \lambda_{l_p}(u) \|u_0\|_{cb} \).

(ii) On the other hand, if \( w : X \rightarrow Y \) is a bounded linear operator between Banach lattices \( X, Y \) such that \( w \) is \( p \)-regular (as defined above) for \( 1 \leq p \leq \infty \), then \( uw \) is \( l_p \)-lattice summing and \( \lambda_{l_p}(uw) \leq \lambda_{l_p}(u) \rho_p(w) \). Indeed, always by (3.1) we have

\[
\left\| \left( \sum_{i=1}^{n} |uwv(e_i)|^p \right)^{\frac{1}{p}} \right\| \leq \rho_p(w) \left\| \left( \sum_{i=1}^{n} |uv(e_i)|^p \right)^{\frac{1}{p}} \right\| \leq \lambda_{l_p}(u) \rho_p(w) \|v\|_{cb}.
\]

We now give some characterizations for the \( l_p \)-lattice summing operators. The technique of proofs depend vigorously on ideas in [16], but slightly different from the original. Because we will be working with the finite dimensional \( l_p^n \) instead of \( L_p \).

**Theorem 3.6.** Let \( 1 \leq p \leq \infty \). Let \( E \) be any operator space and \( X \) be a complete Banach lattice. Then, the following properties of a positive constant \( C \) and a linear map \( u : E \rightarrow X \) are equivalent:
\( (i) \quad u \in \Lambda_{l_p}(E, X) \text{ and } \lambda_{l_p}(u) \leq C. \)

\( (ii) \quad \text{For any } n \in \mathbb{N} \text{ and any } v : l_p^n \to E \text{ such that } \|v\|_{cb} \leq 1, \text{ we have} \)

\[
\lambda_{l_\infty}(uv) \leq C.
\]

In this case we have

\[
\lambda_{l_p}(u) = \sup \left\{ M(uv) : n \in \mathbb{N}, v \in B_{cb}(l_p^n, E) \right\}.
\]

**Proof.** Suppose in the first that \( p \) is finite. Consider \( u \in \Lambda_{l_p}(E, X) \) and \( v \) in \( B_{cb}(l_p^n, E) \). We have

\[
uv(x) = uv\left(\sum_1^n \lambda_i e_i\right) = \sum_1^n \lambda_i uv(e_i)
\]

and therefore

\[
|uv(x)| = \left| \sum_1^n \lambda_i uv(e_i) \right|
\]

(by Hölder’s inequality) \leq \left( \sum_1^n |\lambda_i| p^* \right)^{\frac{1}{p}} \left( \sum_1^n |uv(e_i)|^p \right)^{\frac{1}{p}}

\leq \|x\| \left( \sum_1^n |uv(e_i)|^p \right)^{\frac{1}{p}}.

Hence

\[
\sup_{x \in B_{l_p^n}} |uv(x)| \leq \left( \sum_1^n |uv(e_i)|^p \right)^{\frac{1}{p}}.
\]

Taking the norm on both sides

\[
\left\| \sup_{x \in B_{l_p^n}} |uv(x)| \right\| \leq \left\| \left( \sum_1^n |uv(e_i)|^p \right)^{\frac{1}{p}} \right\|
\]

\leq \lambda_{l_p}(u) \|v\|_{cb}.

This implies by using (3.1) that

\[
\lambda_{l_\infty}(uv) \leq \lambda_{l_p}(u) \leq C.
\]
Conversely, let \( n \) be an integer in \( \mathbb{N} \) and \( v \) be an operator in \( B_{cb}(r^*_p, E) \) such that \( v(e_i) = x_i \). We have

\[
\left\| \left( \sum_{i=1}^{n} |u(x_i)|^p \right)^{\frac{1}{p}} \right\| = \left\| \left( \sum_{i=1}^{n} |uv(e_i)|^p \right)^{\frac{1}{p}} \right\| 
\]

(by (1.1))

\[
\leq l(uv) 
\]

(by (1.2) and (3.3))

\[
\leq \lambda_{l_\infty}(uv) 
\]

\[
\leq C. 
\]

This implies \( \lambda_{l_p}(u) \leq C \).

The case \( p = \infty \). \( i \implies ii \) is trivial by Remark 3.5.i. Conversely, Let \( x_1, \ldots, x_n \) in \( E \), \( \epsilon > 0 \) and \( E_0 \) be the subspace of \( E \) spanned by \( x_1, \ldots, x_n \). Consider the following diagram

\[
l_1^N \stackrel{q}{\rightarrow} E_0 \stackrel{i}{\rightarrow} E \stackrel{u}{\rightarrow} X
\]

where \( q \) is the canonical surjection from \( l_1^N \) (\( N \) is suitably chosen) into \( E_0 \). By (2.5), \( \|q\|_{cb} = \|q\| \leq 1 + \epsilon \). Then we can take \( v = iq \). Hence \( uv \in \Lambda_{l_\infty}(l_1^N, X) \) implies that \( u \in \Lambda_{l_\infty}(E, X) \) which concludes the proof. \( \square \)

**Corollary 3.7.** Consider \( p, E, X \) and \( u \) as in the above theorem. We have

\[
\Lambda_{l_\infty}(E, X) \subset \Lambda_{l_p}(E, X) \subset \Lambda_{l_2}(E, X)
\]

and

\[
\lambda_{l_2}(u) \leq \lambda_{l_p}(u) \leq \lambda_{l_\infty}(u). 
\]

**Proof.** The second inequality is a simple consequence of Remark 3.5.ii. Concerning the first and before embarking on the proof, let us recall some facts about \( l_2^N \) and its embedding into \( L_2^N \). Let \( D = \{-1, +1\}^N \) equipped with its normalized uniform measure \( \mu \) and its Borel \( \sigma \)-algebra \( \mathcal{B} \). We denote by \( \varepsilon_i : D \rightarrow \{-1, +1\} \) the \( i \)-th coordinate and let \( \mathcal{B}_n \) be the \( \sigma \)-algebra on \( D \) generated by the first \( n \)-coordinates. \( L_p(D, \mathcal{B}_n, \mu) \) is isometric to \( L_p^N \) (where \( L_p^N \) is the space \( \mathbb{R}^N \) (or \( \mathbb{C}^N \)) equipped with the norm \( \left\| \{\alpha_i\}_{1 \leq i \leq N} \right\|_{L_p^N} = \left( \frac{1}{N} \sum_{i=1}^{N} |\alpha_i|^p \right)^{\frac{1}{p}} \) if \( p \) is finite and we take \( \max_{1 \leq i \leq N} |\alpha_i| \) if \( p \) is infinite.)
From some classical inequalities of Kintchine, we have: for each $p$ there are positive constants $A_p$ and $B_p$ such that
\[
A_p \left( \sum_{i=1}^{n} |\alpha_i|^2 \right)^{\frac{1}{2}} \leq \left\| \sum_{i=1}^{n} \alpha_i \varepsilon_i \right\|_{L_p(D,B_n,\mu)} \leq B_p \left( \sum_{i=1}^{n} |\alpha_i|^2 \right)^{\frac{1}{2}}.
\]

We denote by $R_n^p$ the closed linear subspace of $L_p^n$ of the functions $\{ \varepsilon_i, 1 \leq i \leq n \}$. By the above inequalities, $R_n^p$ is isomorphic to $l_2^n$. Let $r_n^p : R_p^n \to l_2^n$ be this isomorphism. We can take $\|r_n^p\|_{cb} \leq 1$. We know by [20, p. 109] that there is a c.b. projection $P_p : L_p^{2n} \to R_p^n$.

Consider now the following diagram
\[
L_p^{2n} \xrightarrow{F_p} R_p^n \xrightarrow{r_p^n} l_2^n \xrightarrow{v} E \xrightarrow{u} X.
\]

If $u \in \Lambda_{l_p}(E, X)$ then $u v r_p^n P_p \in \Lambda_{l_\infty}(E, X)$. As $r_p^n P_p$ is surjective then $uv \in \Lambda_{l_\infty}(l_2^n, X)$ and therefore $u \in \Lambda_{l_2}(E, X)$.

**Corollary 3.8.** If we replace $E$ by $OH$ in Corollary 3.7, then
\[
\Lambda_{l_\infty}(OH, X) = \Lambda_{l_2}(OH, X).
\]

**Proof.** Consider $u$ in $\Lambda_{l_2}(OH, X)$. Let $n \in \mathbb{N}$ and $i : OH_n \to OH$ be the canonical injection. We have $ui \in \Lambda_{l_\infty}(OH_n, X)$ and by Remark 3.5.i, $u \in \Lambda_{l_\infty}(OH, X)$.

Before stating the next result, it will be convenient to recall here the following definition: we say that a bounded linear operator $u$ between Banach spaces $X, Y$ is integral and we write $u \in I(X, Y)$ if it admits a factorization
\[
X \xrightarrow{\alpha} C(K) \xrightarrow{id} L_1(K, \mu) \xrightarrow{\beta} Y
\]
where $\mu$ is a probability measure on a compact $K$ and $\alpha, \beta$ are bounded linear operators. The integral norm of $u$ is the infimum of all possible values of $\|\alpha\| \|\beta\|$ in the previous diagram. The integral operators $I(X, Y)$ with norm $i(u)$ form a Banach operator ideal.

**Proposition 3.9.** Let $u$ be a linear operator from an operator space $E$ into a complete Banach lattice $X$. Then, the following conditions of a positive constant $C$ are equivalent:

(i) $u \in \Lambda_{l_\infty}(E, X)$ and $\lambda_{l_\infty}(u) \leq C$. 

For every \( n \) in \( \mathbb{N} \) and every positive \( w : X \to l^p_n \), \( \|w\| \leq 1 \) then \( w u \) is integral and \( i(wu) \leq C \).

Moreover,

\[
\lambda_\infty(u) = \sup \left\{ i(wu), n \in \mathbb{N} \text{ and } w \in B^+_{B(X,l^p_n)} \right\}.
\]

**Proof.** (ii) \( \implies \) (i). By (3.3) we consider \( u \) in \( \Lambda_\infty(E,X) \). Let \( n \) be in \( \mathbb{N} \) and let \( w : X \to l^p_n \) be a positive operator. By Remark 1.5, we have \( w u \) order bounded from \( E \) into \( l^p_n \) and hence integral by [11, Proposition 3.1] because \( l^p_n \) is 1-concave with \( C_1(l^p_1) = 1 \) or by [5, Theorem 5.19, p. 104] we have

\[
i(wu) = M(wu)
\]
(by (1.3))

\[
\lambda_\infty(u) \leq \|w\| \lambda_\infty(u).
\]

(ii) \( \implies \) (i). Consider \( x_1, \ldots, x_n \) in \( B_E \). Let \( y = \sup \{|u(x_i)|, 1 \leq i \leq n\} \). Let \( L(y) \) be an abstract \( L_1 \)-space generated by \( y \) (see [8, p. 221]) and let \( w : X \to L(y) \) the natural map (which is positive) such that \( \|w(y)\| = \|y\| \). Let \( M = \{wu(x_i), 1 \leq i \leq n\} \cup \{w(y)\} \) which is finite and \( \epsilon > 0 \). We know by [5, Lemma 3.3] that there exists an \( N \) in \( \mathbb{N} \), a finite rank projection \( p \) in \( B(L(y)) \), where \( p(L(y)) \) is isomertrically isomorphic to \( l^p_N \) with \( N = \dim(p(L(y))) \), and \( \|p\| = 1 \) such that, for all \( i \)

\[
\|pwu(x_i) - wu(x_i)\| < \epsilon
\]

and

\[
\|pw(y) - w(y)\| < \epsilon
\]

Consider the following diagram

\[
E \xrightarrow{u} X \xrightarrow{w} L(y) \xrightarrow{p} l^N_1.
\]
Thus, we have that
\[
\left\| \sup_{1 \leq i \leq n} |u(x_i)| \right\| = \|y\| = \|w(y)\| = \left\| w \left( \sup_{1 \leq i \leq n} |u(x_i)| \right) \right\|
\]
\[
\leq (1 + \epsilon) \|pw(y)\| = (1 + \epsilon) \left\| pw \left( \sup_{1 \leq i \leq n} |u(x_i)| \right) \right\|
\]
\[
\leq (1 + \epsilon) \left\| \left( \sup_{1 \leq i \leq n} |pwu(x_i)| \right) \right\|
\]
\[
\leq (1 + \epsilon) \lambda_{\infty} (pwu)
\]
\[
\leq (1 + \epsilon) i (pwu)
\]
\[
\leq (1 + \epsilon) C,
\]
as desired. \(\square\)

The next theorem translates the tie between the \(l_p\)-summing and \(l_p\)-lattice summing operators for \(p = 1\) or \(p = 2\).

**Theorem 3.10.** Let \(p \in \{1, 2\}\). Let \(u\) be a linear operator from an operator space \(E\) into a complete Banach lattice \(X\). The following properties are equivalent:

\((i)\) \(u \in \Lambda_{l_p} (E, X)\).

\((ii)\) For every \(n \in \mathbb{N}\) and every \(p\)-regular \(w: X \rightarrow l_1^n\) then, \(wu\) is \(l_p\)-summing.

Moreover
\[
\lambda_{l_p} (u) = \sup \{ \pi_{l_p} (wu), \, n \in \mathbb{N}, \, w : X \rightarrow l_1^n \text{ ap-regular, } \|w\| = 1 \}.
\]

**Proof.** Let \(1 \leq p < \infty\). Consider \(u \in \Lambda_{l_p} (E, X)\), \(n \in \mathbb{N}\) and \(w\) a \(p\)-regular operator from \(X\) into \(l_1^n\). As \(l_1^n\) is \(p\)-concave (Remark 1.2) we have
\[
\left( \sum_{1}^{n} \|wu(x_i)\|^p \right)^{\frac{1}{p}} \leq \left\| \left( \sum_{1}^{n} |wu(x_i)|^p \right)^{\frac{1}{p}} \right\|
\]
\[(\text{Remark 3.5.ii}) \]
\[
\leq \|w\| \left\| \left( \sum_{1}^{n} |u(x_i)|^p \right)^{\frac{1}{p}} \right\|
\]
\[
\leq \|w\| \lambda_{l_p} (u) \sup_{a,b \in B_{S_2p(H)}^+} \left( \sum_{n=1}^{N} \|axb\|_{S_p(H)}^p \right)^{\frac{1}{p}}.
\]
This implies that \(wu\) is \(l_p\)-summing and \(\pi_{l_p}(wu) \leq \|w\| \lambda_{l_p}(u)\). Assume now that \(p = 1\) or \(2\) and that \(wv \in \pi_{l_p}(E, l_1^p)\) for every \(n\) in \(\mathbb{N}\) and every \(p\)-regular \(w : X \rightarrow l_1^p\). Let \(v \in cb\left(l_1^p, E\right)\). We have by [14, Remark 2.1, p. 702] that \(wuv \in \pi_{l_p}\left(l_1^p, l_1^p\right)\) and hence by Remark 3.2.2 for \(p^* = \infty\) and by Remark 3.2.3 for \(p^* = 2\), we have \(wuv \in \pi_p\left(l_1^p, l_1^p\right)\). This implies that \(wuv\) is integral. By Proposition 3.9, we have \(uv\) in \(l_1\left(l_1^p, X\right)\) and by Theorem 3.6, we conclude that \(u\) is in \(\pi_{l_p}(E, X)\).

**Remark 3.11.** We can replace \(l_1^p\) in the first implication by any \(p\)-concave space \(Y\) and this by [4, Corollary 7] because every \(p\)-regular operator is \(p\)-concave.

### 4. Comparison with the commutative case.

Let us concentrate on the case where \(E = B(H)\) and \(X = OH\). The main result of this section is to prove that \(\pi_{l_p}(B(H), OH) \neq \Lambda_{l_2}(B(H), OH)\), for all \(2 < p < \infty\) unlike the commutative case [16, Theorem 1.5], where it is shown that \(\pi_p(E, X) \subset \Lambda_2(E, X)\) for all \(p, 2 < p < \infty\).

**Proposition 4.1.** Consider \(2 < p < \infty\). Then,

\[\pi_{l_p}(B(H), OH) \neq \Lambda_{l_2}(B(H), OH)\]
Remark 4.3. We can say that the little Grothendieck’s theorem is not valid in the case of $l_p$-lattice summing operators.

Acknowledgement. The author is very grateful to the referee for several valuable suggestions and comments which improved the paper.
